Matronics LED light bars for Evolution halogen light bar, 24V

Powerful dual color LED light source / bars for Evolution halogen light bar. Easy installation, waterproof design, and uniform lighting.

Powerful and reliable LED light bars, specifically developed for additional lighting in Evolution halogen beacon bars. These long light bars provide uniform and strong illumination across the bar, creating a modern cruise-light effect.

The bars are available in Dual color or RGB

The solution consists of two heavy-duty LED aluminum bars connected in series. One is installed on each side of the beacon bar, ensuring even light distribution throughout the bar and producing an impressive effect in the internal mirrors.

Long durability

Designed for trucks, these light bars require no special regulator or protection. They connect directly to 24V, and you're ready to go.

Easy installation

As the bars are delivered assembled in series, only a single connection is necessary. There are 45cm connection wires and 45cm wire between the two light bars. The back side is equipped with strong double-sided tape, making installation quick and easy.

We recommend measuring the inside of the bar to ensure correct length. The mounting surface must be flat and clean if the bars are to be adhered.

The bars are placed on the aluminum plate at the bottom of the bar. Loosen the screws on the reflectors and temporarily remove them for easier installation of the bars.

Robust construction for demanding environments

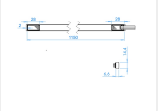

- Made from aluminum for optimal heat dissipation and long lifespan
- Thermally conductive tape ensures low operating temperature
- Encapsulated design makes the light bar waterproof and suitable for outdoor use
- Resistant to vibrations from daily driving

Connection, Dual color

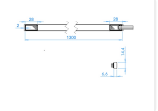

Dual color versions are supplied with 3 wires. The black wire is always ground, while the other two wires are color-coded according to the light color they activate.
Example: Yellow wire = yellow light.
